Answers grounded in your uploaded notes only — no hallucinations.

Hi Aarav! I'm ready to help with your Biology chapter 4 notes. What would you like to know?

Summarise the key points on photosynthesis

From your notes, the 3 key points are:

1. Light reaction produces ATP
2. Calvin cycle fixes CO₂
3. Glucose is the final product

Would you like me to read this aloud?

Q 3 / 15

Question 3 of 15

In photosynthesis, which molecule is produced as a by-product of the light reaction?

○

☒ A. Oxygen (O₂)

☐ B. Carbon dioxide (CO₂)

☐ C. Glucose (C₆H₁₂O₆)

☐ D. Water (H₂O)

Correct! Oxygen is released when water is split during the light reaction.

COMPONENT BREAKDOWN

Logo	Top-left · navigation bar Icon mark + wordmark creates instant brand recognition. Clicking returns to the welcome screen from any page. Screen reader reads "LearnAI home".
A11y strip	Below nav · persistent toolbar Five accessibility toggles shown before any content loads — audio-first, high contrast, large text, dyslexia font, screen reader. State persists in localStorage. ARIA pressed states announced to screen readers.
Page title	Hero · centre · H1 "Study smarter with AI-powered learning" — the single H1 on the page, used by screen readers as the document title. Font size 28px at minimum 4.5:1 contrast ratio. Purple keyword draws the eye to the value proposition.
Welcome message	Hero · below title · 14px body Concise 2-sentence description covering the core pipeline (notes → audio → quizzes) and the inclusive design commitment. Max-width 440px prevents wide uncomfortable line lengths.
Get started btn	Hero · primary CTA · solid fill Highest visual weight — purple fill, largest tap target (44px tall). "Get started — it's free" removes friction by making the no-cost offer explicit. Keyboard focus ring visible. Leads to registration flow.
Login button	Nav top-right + hero · secondary CTA Available in two places — top nav (for returning users scanning the nav) and hero (for users who scroll). Outline style signals a lighter commitment than "Get started". ARIA label distinguishes from Register.
Register button	Nav top-right · filled style Sits in the top-right — a globally understood position for auth actions. Filled purple pill to stand out from the ghost "Sign in" beside it. Triggers the account creation flow.
Feature cards	Below hero · 3-column strip Three core features with colour-coded icons (purple = OCR, teal = voice, amber = quizzes). Each card is role="listitem" for screen readers. Short labels and plain-language descriptions for cognitive accessibility.
Trust strip	Below features · reassurance row Five short proof points — free tier, no card, WCAG compliance, privacy, cross-device. Addresses the top objections a student or carer would have before registering. Teal checks signal positive status.
Footer	Bottom · secondary background Logo repeat anchors the brand. Five text links cover legal and support needs — Accessibility link is mandatory for WCAG compliance. Copyright text is muted so it doesn't compete with nav links. Semantic footer element for screen reader landmark navigation.

COMPONENT BREAKDOWN — PURPOSE, INTERACTIONS & ACCESSIBILITY

Sidebar nav Left rail — grouped navigation Three labelled groups (Main, Practice, Track) reduce cognitive load. Active state uses left border + purple text. Keyboard navigable with tab and enter. Screen readers announce the current page via aria-current="page". User profile at the bottom anchors identity without consuming prime space.	Atly toolbar Persistent strip — always first to render Audio-first, high-contrast, large text, and screen-reader modes are toggled without page reload. Each button uses aria-pressed for state announcements. Purple background makes it visually distinct from content — users with visual impairments spot it immediately. Active state stored in localStorage across sessions.
Progress stats 4-card row — daily snapshot Notes uploaded, quiz average, study time, and cards mastered give a complete daily picture at a glance. Delta indicators (+2 today) use colour and icon together — never colour alone — so colourblind users read the same information. Each card is role="listitem" and aria-labelled for screen readers.	Feature cards 8-item grid — primary navigation hub Each feature is a focusable card with a colour-coded icon, name, description, and a status badge. Hover state adds a purple border to indicate clickability. Full keyboard support (tab + enter), aria-label on each card reads the full description, not just the title. Dashed "Explore more" card invites discovery without clutter.
Recent notes Left column — resume learning instantly Each note row shows title, page count, status, and a progress bar so users immediately know where they left off. Inline action buttons (voice, AI) let users launch a feature directly from a note without navigating away. Disabled state on processing notes uses opacity and a disabled attribute to prevent accidental interaction and screen-reader announcement.	Quick actions 8-button grid — one-tap shortcuts The 8 most common actions (upload, quiz, flashcards, AI, play, remind, analytics, report) available without scrolling or navigating. Each button has a large icon (20px) for motor-impaired users with low precision. aria-label on every button gives screen readers a clear action description beyond the icon label.
Reminders panel Right column — schedule at a glance Three scheduled sessions shown with toggle switches. Toggle state uses role="switch" and aria-checked so screen readers announce "on" or "off" without ambiguity. Subject and time shown in muted text below the session name — information hierarchy is preserved without extra elements. "Manage reminders" link provides a clear path to the full settings screen.	Subject coverage Right column — gap detection + live alert Horizontal progress bars for each subject use distinct colours (purple → teal → amber → red) that escalate visually with coverage level. The red alert for Maths uses roles="alert" and aria-live="polite" so screen readers announce it without interrupting current reading. The system auto-suggests a reminder — closing the loop between analytics and action.

Submit for OCR processing

Your notes are processed privately — never shared

- Drop zone

Centre of screen · primary upload target

Dashed border signals drag-and-drop capability. Accepts mouse drag, touch drag, and keyboard activation (Enter/Space). aria-label reads full instructions including accepted formats. Border turns solid purple on dragover and focus. Large tap target (min 140px tall) for motor-impaired users.
- Camera button

Below drop zone · primary filled CTA

Purple fill (highest visual weight) because camera capture is the most common action on mobile — students photograph notes rather than export files. aria-label explicitly says "Open camera to capture your notes". Minimum 44×44px touch target. Opens the device camera API directly.
- Preview panel

Left column after upload · review before submit

Shows a thumbnail of the uploaded file with inline edit actions: rotate, crop, enhance, remove. Quality badges (legibility, orientation, brightness) use both colour and icon — never colour alone — so colourblind users read the same information. Estimated OCR confidence is shown numerically.
- Warning system

Inline · contextual · non-blocking

Warnings (low brightness, poor focus) appear inside the preview panel — not as modal dialogs — so the workflow isn't interrupted. role="note" for advisory messages. Suggestions include a specific action ("Tap Enhance") not just a diagnosis, reducing cognitive load for students with ADHD or dyslexia.
- Error state

Replaces preview area · role="alert"

Errors use role="alert" and aria-live="assertive" so screen readers announce them immediately on upload failure — without the user needing to tab to the error. Each error message explains the problem and the exact recovery action in plain language. Accepted formats shown visually with green/red tags.
- Processing state

Full screen · pipeline progress visible

Back button is disabled (opacity 0.4 + disabled attr) to prevent accidental cancellation mid-processing. A step-by-step pipeline list (preprocessing → deskew → OCR → cleanup → formatting) gives users visibility into what's happening. "While you wait" shortcuts reduce perceived wait time. Push notification is promised on completion.
- Submit button

Bottom-right · disabled until file uploaded

Disabled state uses aria-disabled="true" and cursor:not-allowed — not just a visual change — so assistive technologies report it correctly. Once enabled, the button label changes to include the note title ("Submit Biology chapter 4...") so users confirm they're submitting the right file before OCR runs.
- Enhancement options

Below drop zone · pre-selected defaults

Auto-enhance and deskew are on by default — the two settings that most improve OCR accuracy with zero effort from the user. Each option is a role="checkbox" with aria-checked, so screen readers announce selected state. Options that aren't selected are visually neutral (no fill) — clear visual hierarchy without overwhelming new users.

Chapter 4 — Photosynthesis selected

Photosynthesis is teh process by which plants convert sunlight, w@ter, and carbon dioxide CO2 into glucose and oxygen.

The reaction occurs primarily in the chl0roplasts, specifically within the thylakoid membranes. Chlorophyll pigments absorb light energy, initiating the light-dependent reactions.

Stage 1: Light reactions — water molecules are split (photolysis), releasing O2 as a by-product and producing ATF and NADPH.

Stage 2: Calvin cycle — uses en3rgy from Stage 1 to fix CO2 into organic molecules via Rubis0.

Amber = possible error · Red underline = confirmed error · Click any word to fix

Run AI cleanup

Error highlighting

Inline · two severity levels

Amber underline = possible error (digit substitution, symbol confusion). Red underline = confirmed error (repeated pattern, high-confidence misread). Both use colour AND underline style — never colour alone — so colourblind users read the same severity. Each highlighted word is a focusable button with aria-label reading "Possible OCR error: [word] — suggested correction: [fix]".

Two-pane layout

Text left · error panel right

The raw text fills the left pane at reading width. The right pane shows all errors as a clickable list — users can jump to any error without scrolling through the full text. Clicking an error in the list selects it in the text and populates the fix suggestion panel below. This bidirectional navigation prevents students from missing errors buried mid-paragraph.

Edit mode

Full textarea with line numbers

A monospaced textarea with line numbers lets students correct OCR directly. Browser spellcheck is enabled (spellcheck="true") so the browser underlines genuine spelling errors independently of OCR analysis. Find & Replace in the side panel handles systematic errors like "CO2 → CO" across all three occurrences simultaneously. Undo/redo is preserved in the topbar.

AI diff view

Before/after inline diff

After AI cleanup, changes are shown as an inline diff — red strikethrough for removed text, green highlight for additions. This is critical: students must see exactly what the AI changed so they can catch domain-specific terms like "RuBisCO" being altered incorrectly. Each change in the right panel has an individual reject button. Students never accept all changes blindly.

Save button

Bottom bar · state-aware label

The save button changes label depending on context: "Save edits" in edit mode, "Accept & save" in diff view. This reduces cognitive load — the label always describes the action in the current context. The teal colour distinguishes it from the purple AI cleanup action. Disabled state (not shown) is used when no changes exist to save.

Confidence score

Status bar + progress bar

The 74% raw confidence score rises to 96% after AI cleanup — shown as both a number and a colour-coded bar (amber at 74%, green at 96%). This makes the value of running AI cleanup tangible before the student commits. "Estimated post-cleanup: 96%" is shown even on the raw screen so the student knows what to expect before clicking the button.

Screen reader support

aria-labels · live regions · roles

Every highlighted error word has a full aria-label with both the original and suggested text. The error list uses role="list" with role="listitem" on each row so screen readers announce both the list context and the interactive nature. The diff view aria-labels each span as "Removed: [text]" or "Added: [text]" — a screen reader user gets a complete spoken diff without visual output.

Navigation flow

Three routes · always recoverable

Raw → Edit → Save (manual path). Raw → AI cleanup → Diff → Accept & Save (automated path). Raw → Re-upload (restart path). Every bottom bar has a back action so no decision is irreversible. The workflow strip at the top (Upload → OCR → Review → Cleanup → Voice/Quiz) shows where the student is in the overall journey and what comes next.

Chapter 4 — Photosynth3is

Photo0ynthesis is teh process by which plants convert sunlight, w@ter, and carbon dioxide CO2 into glucose and oxygen.

The reaction occurs primarily in the ch10roplasts, specifically within the thylakoid membranes. Chlorophyll pigments absorb light energy, initiating the light-dependent reactions.

Stage 1: Light reactions — water molecules are split (photolysis), releasing O2 as a by-product and producing ATP and NADPH.

Stage 2: Calvin cycle — uses en3rgy from Stage 1 to fix CO2 into organic molecules via Rubis0.

Amber = possible error · Red = confirmed error

Chapter 4 — Photosynthesis

Photosynthesis is the process by which plants convert sunlight, water, and carbon dioxide CO₂ into glucose and oxygen.

The reaction occurs primarily in the chloroplasts, specifically within the thylakoid membranes. Chlorophyll pigments absorb light energy, initiating the light-dependent reactions.

Stage 1: Light reactions — water molecules are split (photolysis), releasing O₂ as a by-product and producing ATP and NADPH.

Stage 2: Calvin cycle — uses energy from Stage 1 to fix CO₂ into organic molecules via RuBisCO.

WCAG formatting applied · scientific terms preserved · screen-reader headings added

Discard

Regenerate

Review sentence by sentence

Accept all & save ✓

Side-by-side view

Original left · cleaned right · always aligned

The two-pane layout lets students compare at their own pace without scrolling. Both panes scroll independently but stay aligned by paragraph so students never lose their place. Errors in the left pane are highlighted amber (possible) or red (confirmed) — the cleaned right pane shows green highlights exactly where each fix was made, creating a direct visual mapping between problem and solution.

Inline diff view

Single pane · red strikethrough + green addition

For users who prefer a compact single-column view — common among screen-reader users and students with motor impairments who find panning between columns tiring. Every change is inline: the removed text sits immediately before its replacement. Each span carries a full aria-label ("Removed: CO₂" / "Added: CO₂") so a screen reader announces the complete diff without any visual reference needed.

Sentence-by-sentence review

Granular control · accept / reject / edit per sentence

Science students risk having domain-specific terms ("RuBisCO", "ATP") altered incorrectly by the AI. This view gives per-sentence control: Accept, Reject (keep original), or Edit manually. Accepted sentences turn green with an Undo button. Pending sentences are highlighted in purple. A "Read aloud" button on each sentence lets auditory learners listen before deciding, without committing to the full text.

Regenerate button

Amber fill · second priority after Accept

If the AI cleanup missed an error or over-corrected a term, the student can regenerate without going back to the OCR screen. Amber colour signals "caution" — this will replace the current cleanup. The button is present in all three views. Regeneration reruns the selected AI model (Claude or Ollama) with a fresh pass, not a cached response. A loading state with progress bar replaces the text panels during regeneration.

Model selector

Claude (cloud) vs Ollama (local) — visible at all times

The model selector sits in a persistent strip just below the topbar — always one click away without navigating to settings. Claude is the default for highest accuracy. Ollama is offered for students who need data privacy (peer notes that shouldn't leave the device) or who are offline. Switching model triggers a confirmation and regeneration. The active model is shown as a pill in the status bar so students always know which AI produced the current cleanup.

Confidence gain display

Before 74% → After 96% · visible in status bar

Showing the confidence jump numerically (74% → 96%) makes the value of AI cleanup tangible before the student commits to accepting it. The colour coding — amber for pre-cleanup, green for post-cleanup — is mirrored in the pane header colours, creating a consistent visual language. This also helps teachers understand the quality improvement when students share cleaned notes.

Accessibility: audio support

Read aloud on every pane and sentence

Three levels of audio support. (1) Pane-level: "Read" button in each pane header reads the full original or cleaned text via ElevenLabs. (2) Sentence-level: each pending sentence in the merge view has a "Read aloud" button so auditory learners can hear the before/after without reading. (3) Topbar: a persistent volume button reads the current active pane. Screen-reader optimised WCAG formatting is automatically applied during cleanup — subtitles, headings, and text alternatives are all set correctly.

Accept & save flow

Three save paths · all non-destructive

"Accept all & save" in side-by-side/diff views saves all 11 fixes at once — the fastest path for most students. "Accept remaining & save" in sentence review saves accepted sentences plus any pending ones. Rejected sentences revert to original OCR text. After saving, the student is routed to the Voice Reader screen with the clean text pre-loaded. No data is lost — both the original OCR text and the cleaned version are stored separately, so students can always revert.

Hero player Dark gradient canvas — audio-first visual identity The deep purple-to-violet gradient signals an immersive audio mode — distinct from every other screen so students instantly know they are in the “listening” zone. The animated waveform (played bars lighter, active bars white, upcoming bars dimmed) gives a real-time visual of progress without numbers. All colour choices pass WCAG AA contrast on the dark background. The play button is white on purple — the highest-contrast element on screen — guiding the eye even for low-vision users.	Sync transcript Word-by-word highlight scrolls with audio The transcript panel highlights the exact phrase being spoken in real time — purple background on the active span, grey for already-read text, normal for upcoming text. This serves two groups simultaneously: visual learners who read along with audio, and students with ADHD who need a visual anchor to prevent mind-wandering. aria-live=“polite” announces each new highlighted region to screen readers without interrupting the audio description flow. Students can tap any transcript sentence to jump audio to that position.
Play / Pause / Stop Three distinct controls — size + colour encode priority Play/Pause is the largest button (52px) in white — dominant. Skip-back and fast-forward are medium (36px) semi-transparent — secondary. Stop is the same size as skip controls — available but not prominent, preventing accidental resets. In the Stopped state, skip/forward/stop buttons are disabled (opacity 0.35 + disabled attribute) so screen readers announce them as unavailable. Spacebar always triggers Play/Pause — matching muscle memory from every media player students have used.	Speed control Preset buttons + fine-tune slider — dual control Six preset buttons (0.5x to 2x) for one-tap switching — critical for students with dyslexia who often need 0.75x to process speech, and commuting students (Ishaan’s persona) who use 1.5x to cover more content. The range slider between 0.5x and 2x allows fine adjustment for users who need exactly 1.1x for comfortable listening. Arrow-up/down keyboard shortcuts increment by 0.25x without touching the slider. The current speed always shows as a number (“1.0x”) — not just as a selected button state, which benefits screen reader users.
Voice selection Four profiles, preview before committing Four ElevenLabs voice profiles covering warm/formal/expressive/calm — matching different subject moods (Ravi for calm Maths, Anika for expressive Literature). Every card has a preview button that plays a 5-second sample without switching the current note — students audition a voice before committing. The selected voice uses both a purple border AND a filled background — never border alone — so colourblind users see the selection. role=“radio” and aria-checked announce the selected state to screen readers.	Download MP3 MP3 + transcript PDF — two formats for different needs MP3 download serves Ishaan’s commute persona — listening offline without the app. Transcript PDF serves Arjun’s screen reader persona — a WCAG-formatted document with proper heading structure and text alternatives. File size is shown upfront (4.2 MB / 0.3 MB) so students on limited mobile data can decide before downloading. The privacy note (“saved locally — never uploaded”) addresses the data concern raised in the research PDF for students sharing peer notes.
Keyboard shortcuts Persistent shortcut strip — always visible Five keyboard shortcuts displayed at the bottom of the transcript panel: Space (play/pause), ←→ (10s), T (speed), B (bookmark), S (stop). These are styled as visual keyboard key symbols — not just text — so they read as shortcuts at a glance. For motor-impaired users who cannot use a pointer, full keyboard control removes the dependency on precise clicking. Tab order follows the spatial layout: toobar → a11y bar → speed → transcript → controls — matching the reading flow.	Playback queue Up-next panel — auto-continues study session The queue shows the next 3 notes with subject colour coding matching the dashboard — Biology purple, History amber, Chemistry teal, Maths green. Auto-continue means Rohan’s ADHD persona (from the research document) can queue all tonight’s subjects and study hands-free on his commute without having to interact between notes. Total queue time (19:14) is shown at the bottom so students can plan how many notes fit in a study slot. role=“list” with aria-label announces the queue context to screen readers.
